Professional Summary

Software Engineer who builds production-grade frontend and backend systems that solve real user problems, not just tech demos. Skilled in modern frontend architectures, scalable backend systems, and AI-powered workflows, with a track record of shipping and delivering complete products end to end, from freelance client work to open-source tools.

Technical Skills

- **Languages:** JavaScript, TypeScript, Python, HTML5, CSS3
- **Frontend:** React.js, Next.js, React Native, Redux, Redux Toolkit, Three.js, GSAP, TailwindCss, BootStrap
- **Backend:** Django, Django REST Framework, FastAPI, Nest.js, Node.js, Express.js
- **Databases:** SQL, PostgreSQL, SQLite, MongoDB
- **Infrastructure & Tools:** Git, DevOps Core, Computer Networking, AI Automation, Prompt Engineering, Loop Engineering

Projects

Raahi (Safety-Aware Navigation System) *Freelance Project*

TenStack, React.js, TomTom API, MapTiler API

- Solved a real gap in mainstream navigation apps by building a prototype that scores routes on actual safety, factoring lighting, crime tendency, community reports, and live incidents, instead of optimizing for ETA or distance alone.
- Architected the system with MVVM and Clean Architecture (Retrofit, OkHttp, Moshi, Room, Coroutines/StateFlow) to deliver a production-quality, testable codebase for a paying client.
- Kept the project on schedule through a mid-development Google Maps outage by re-engineering the routing layer around the TomTom Routing API and MapTiler API under real deadline pressure.

AniTrack (Track your Anime journey)

Python, TypeScript, FastAPI, Django, Redis, JWT

- Engineered a full-stack platform end to end that solves a genuine user problem, scattered, manually-tracked anime progress, by giving users one reliable place to log watchlists and episode progress in real time.
- Designed RESTful APIs and a responsive UI that keep data synchronized across sessions without state conflicts, ensuring a smooth experience under real usage.
- Turned raw activity into insight by shipping dynamic search and interactive visual analytics for watch-time patterns and personal ratings.

VerteX (AI-Powered Learning Platform)

Next.js, TypeScript, Sanity, OpenAI, PostHog

- Engineered an AI-driven learning platform that lets users search course catalogs using natural language and jumps straight to the exact video timestamp where a topic is explained.
- Built an intelligent backend integration using Sanity Context MCP and OpenAI to match chapter markers and transcript chunks for precise, grounded search results.
- Designed a split architecture separating the Next.js App Router client application from Sanity Studio, ensuring secure server-side data fetching and robust route protection with Clerk.
- Tracked learner engagement, watch depth, and lesson completion across the platform by integrating PostHog product analytics.

AirPods-Controle (Android BLE App)

Kotlin, Jetpack Compose, BLE, Room

- Solved a real cross-platform gap: AirPods lose their native controls on Android, so I engineered a full-featured open-source app that restores that missing functionality using Kotlin, Jetpack Compose, and BLE APIs.
- Implemented real-time battery tracking, Noise Control switching (ANC/Transparency), and optical in-ear detection, features Apple never exposed outside iOS.
- Closed the audio-quality gap between platforms by building a custom DSP engine with a 5-band graphic equalizer, custom presets, and a 3D spatial virtualizer.
- Ensured reliability in production use with a persistent Foreground Service and Room-backed diagnostic logging, so device state and connection data survive across sessions.

Education

Master's Degree in Islamic Studies Expected 2027
Currently Pursuing

Bachelor's Degree in Islamic Studies Completed 2025
Graduated
